

Dear Hiring Manager,

I am writing to express my interest in the Data Engineer opportunity at your organisation. With over 6 years of experience designing and optimising scalable data platforms, I bring strong expertise in building cloud-native data solutions across Azure, Databricks, and Snowflake ecosystems.

In my current role as Principal Software Engineer (Data Engineer), I design and implement high-performance data pipelines that support large-scale retail analytics systems. My work focuses on building Medallion Architecture-based data platforms, developing automated data validation frameworks, and ensuring high data reliability across real-time and batch processing systems.

I have also contributed to AI-integrated data platforms by developing APIs that integrate with large language models for anomaly detection and intelligent query assistance. Alongside my data engineering responsibilities, I actively contribute to infrastructure automation using Terraform and implement monitoring and observability practices to improve operational visibility of data pipelines.

Beyond technical execution, I enjoy collaborating with cross-functional teams to translate complex business requirements into scalable and maintainable data solutions. My experience working across data engineering, API development, and cloud infrastructure enables me to deliver end-to-end solutions that improve both system performance and data reliability.

I would welcome the opportunity to bring my expertise in cloud data platforms, data quality automation, and AI-enabled systems to your team. Thank you for considering my application, and I look forward to the possibility of discussing how my experience can contribute to your organisation's data initiatives.

Kind regards,

Shaik Malik Basha
